Brian Kennedy

Backend Software Engineer

Nairobi, Kenya | 0705984412 | scxbrian@gmail.com | briankennedy.vercel.app | github.com/scxbrian

PROFESSIONAL SUMMARY

Results-driven Backend Software Engineer specializing entirely in server-side logic, high-performance microservices, and clean data architectures. Intentionally focused on Python and Go to build highly scalable, reliable backends while eliminating frontend complexities. Proven capability in architecting interconnected application ecosystems, implementing containerized data layers, managing bare-metal environments, and translating system metrics into performant code with a strict commitment to production-grade engineering foundations.

TECHNICAL SKILLS

Core Languages: Python (Advanced), Go (Golang)

Backend & Infrastructure: Microservices Architecture, RESTful API Design, Docker Containerization

Databases & Environments: Relational Databases, SQL optimization, Linux Environment (Pop!_OS, Linux Mint), Shell Utilities

Systems & Workflows: Git & GitHub Version Control, System Administration, Advanced Logic & Debugging

EXPERIENCE & ENTREPRENEURSHIP

Founder & Lead Architect

DevBoma Venture Studio | Nairobi, Kenya | Oct 2025 – Present

- Architect and manage the unified technical infrastructure for a scaling ecosystem targeting the African market, including BomaShop (e-commerce) and BomaShip (logistics).
- Design and engineer core server-side logic, database schemas, and robust data flow requirements using Python and Go.
- Implement containerized multi-service workflows using Docker to streamline local and production deployment stages.
- Perform bare-metal server management and Linux system administration to guarantee platform reliability and optimal resource distribution.

Lead Backend Engineer

FlowSignal Platform | Nairobi, Kenya | Oct 2025 – Present

- Designed the structural microservice architecture for an analytics platform specializing in processing raw engagement data to aid creator monetization.
- Engineered backend performance systems leveraging Go's strict compilation models to optimize text processing, query execution, and high-concurrency API performance.
- Developed logic-driven components and data serialization protocols completely independent of bloated frameworks or external code-generation helpers to enforce zero-dependency runtime environments.

EDUCATION & CERTIFICATIONS

Software Engineering Accelerator Certification

Power Learn Project (PLP) | Graduated Dec 2025

- Completed an intensive 16-week software engineering curriculum emphasizing architectural principles, advanced computing paradigms, and robust design practices.

Relational Databases & SQL Certification

University of Helsinki (MOOC) / freeCodeCamp | Completed June 2026

- Deepened understanding of normalized schemas, relational algebra, precise transaction controls, and server-side query optimization.
